

The Gap between Web-scale and Enterprise IT by, Stuart Miniman

June 26th, 2014

The big Internet companies like Google, Amazon, Yahoo and Facebook are having a profound impact on the IT ecosystem. Wikibon has been tracking the hyperscale infrastructure developments for the past few years (see much of this at Wikibon.com/SLI - our Software-led Infrastructure page) and how both the operational models and technologies used are impacting service [...]

The Gap between Web-scale and Enterprise IT

The big Internet companies like Google, Amazon, Yahoo and Facebook are having a profound impact on the IT ecosystem. Wikibon has been tracking the hyperscale infrastructure developments for the past few years (see much of this at Wikibon.com/SLI - our *Software-led Infrastructure* page) and how both the operational models and technologies used are impacting service providers and enterprise environments. The hyperscale (or web-scale) companies still only make up about 20% of IT revenue, but more significantly, most of the growth (see [server revenue](#) as a barometer of this activity). There are significant differences between the applications in hyperscale (custom written to optimize for massive scale) and enterprise (typically off-the shelf), so the theme is not that the enterprise of tomorrow will look like the web companies of today.

Here is the slide deck that I presented at [Web-scale Wednesday](#), an event to discuss bringing web-scale software and solutions to enterprise IT including a brief discussion of [Server SAN](#):

The Coming Disruption to Datacenter Strategies from ***Stuart Miniman***

Other presenters at the webinar included Nutanix (who hosted the event), Twitter, Datastax, CFEngine, Dell, Citrix and Veeam. Jack Clark from The Register and I hosted a [CrowdChat](#) (transcript below) where the value and validity of the thesis of webscale IT was debated. The top conversations were on the definition of the category, the importance of infrastructure and the recent announcement of [Dell OEMing Nutanix](#) software. Participants want to see more definitional clarity and customer proof points.

The Gap between Web-scale and Enterprise IT

Stuart Miniman is an active member of the networking (Ethernet and SAN), virtualization (vExpert 2011-2015) and cloud communities. Stu (even Biz Stone agreed that @stu is a great Twitter handle) is a proponent of linking information and people in IT by leveraging the latest tools and processes from the innovation and social media communities. In past positions, including sales, product management and strategic planning, he has focused on the needs of customers by working with partners to deliver the solutions or information that the customers require. Stuart worked at EMC for 10 years; with a primary focus on storage networking and virtualization technologies. He also worked with voice/video/data solutions at Lucent Technologies (now Avaya) and power solutions at American Power Conversion. He has spoken at many industry conferences and writes for his own blog. Stuart holds a BS in Mechanical Engineering from Cornell University and an MBA from Bryant University.
